Condition Survey

General Description & Observations

The ceilings are pitched slate tiled roofs with a parapet wall to the front elevation. The rainwater goods are cast iron units to the rear. The external walls are a mixture of brick finishes and rendered sections. The windows to the front are timber single glazed sash units which are generally in a reasonable condition. the main windows to the first floor consist of leaded panel units installed circa 1987 and are generally in an adequate condition. The doors to the front are original oak units and to the rear are panelled glazed. Internally there are damaged sections of plasterwork to walls on the staircase where cracks are occurring. The carpeting around most of the building are in an adequate condition, however do appear dated in areas and should be considered in the near future. The heating to the building is fed from the building next door. The lighting around the building is becoming dated and in need of upgrading over the coming years.
